1. Install the USB drivers

The NodeMCU module includes a CP2102 chip for the USB interface. Usually the driver will be installed automatically if the NodeMCU is connected the first time with the PC. Sometimes this procedure failed. In this case you have to install the driver

manually in the Windows device manager.

If you want to use the Wemos D1 you have to install the drivers for the CH340 USB interface instead:

http://www.wch.cn/download/CH341SER_ZIP.html
2. Preparation of Arduino IDE

The ESP8266 and/or ESP32 isn't part of the Arduino-IDE. We have to install it first.

Open the board manager: **Tools / Board / Board Manager**

2.1 ESP8266

Go to the ESP8266 entry and install it:
Now you can choose **NodeMCU 1.0 (ESP-12E Module)**. Set the CPU frequency to 80MHz, Flash Size to „4M (3M SPIFFS)“, the baud rate of your choice and the COM port.

For the Wemos D1 Mini you have to choose **WeMos D1 R2 & mini**. Set the CPU frequency to 80MHz, Flash Size to „4M (3M SPIFFS)“, the baud rate of your choice and the COM port.
2.1 ESP32

Go to the ESP32 entry and install it:

Now you can choose **ESP32 Dev Module**. Set the baud rate of your choice and the COM port.
3. Programming

3.1 Installation of additional libraries

Install the following libraries through Arduino Library Manager

Mini Grafx by Daniel Eichhorn
https://github.com/ThingPulse/minigrafx

Json Streaming Parser by Daniel Eichhorn
https://github.com/squix78/json-streaming-parser/blob/master/library.properties

simpleDSTadjust by neptune2
https://github.com/neptune2/simpleDSTadjust

For ESP8266 only:
ESP8266 WeatherStation by Daniel Eichhorn
https://github.com/ThingPulse/esp8266-weather-station

For ESP32 only:
ESP32 WeatherStation modified by Zihatec
https://github.com/HWHardsoft/ESP32_Weather_Station

You can also download the library also directly as ZIP file and uncompress the folder under yourarduino/sketchfolder/libraries/

After installing the Adafruit libraries, restart the Arduino IDE.

3.2 Source Code

The source code for the weather-station based on the awesome sources by Daniel Eichhorn

https://blog.squix.org

We have made some small changes to made code compatible for AZ-Touch. You can download these sources from our website. You have to unpack the Zip archive in a new directory with the same name.
3.3 Custom settings in settings.h

In the source code you will find a file named settings.h. Some changes in this file are required for customisation:

**WiFi:**

Please enter the SSID and password in the lines 25 and 26 of settings.h

```c
#define WIFI_SSID "yourssid"
#define WIFI_PASS "yourpassw0rd"
```

**Account for OpenWeatherMap:**

To receive later data by the platform OpenWeatherMap you will need an own account. Sign up here to get an API key: [https://docs.thingpulse.com/how-tos/openweathermap-key/](https://docs.thingpulse.com/how-tos/openweathermap-key/)

Enter your API key in line 38 of settings.h

```c
String OPEN_WEATHER_MAP_APP_ID = "your_api_key";
```

**Your location:**

Go to [https://openweathermap.org/find?q=](https://openweathermap.org/find?q=) and search for a location. Go through the result set and select the entry closest to the actual location you want to display data for. It'll be a URL like https://openweathermap.org/city/2657896. The number at the end is what you assign to the constant below.

Enter the number and name of your location in line 45 and 46 of settings.h

```c
String OPEN_WEATHER_MAP_LOCATION_ID = "2804279";
String DISPLAYED_CITY_NAME = "Ziesar";
```

**Time:**

Please choose your timezone in line 65 of settings.h

```c
#define UTC_OFFSET +1
```
3.4 Run the demo

Please open this sample in the Arduino IDE. After compilation and upload you will see the current time and temperature of your location. Further more an weather forecast for the next few days is displayed. The touch has only one function. You can choose the displayed time format by touching in the upper part of the screen.
